4 models - different cutting areas - adjusted machine outputs - many options Beck's cross cut saws permit individual coordination with different uses

- Machine body in stable welded steel construction
- Bilaterally robust saw unit suspension
- Large door in the machine body, opening far, for simple saw blade change
- Pneumatic drive for the saw stroke
- Lifting cylinder with automatic end position dampening (shock absorber)
- Saw blade cut trigger via two-hand safety switch
- Speed of the saw blade infeed can be adjusted gradually
- Automatic fastening of the work piece at every cut
- Safe and fatigue-free shortening of the work pieces, even in permanent operation
- Full protection hood for complete covering of the processing unit (optional)
- Protective shield before saw blade
- Sawing via pneumatic feed unit - no manual pulling as in usual chop saws
- Saw blade will automatically dip below the saw table after each saw cut
- Supply and stop roller tracks with various stop systems for safe material support and perfect cuts
- Electrical switching via cam shaft switches with star/triangular start-up
- Replaceable wear rails of aluminium in the saw blade area

UTK 600 Special models

The cross cut saw UTK 600 had been optimized with the necessary accessory elements for this special purpose.

The metal tubes to be cut-to-length are fixed securely in a special mount during each cut. Both EXAKT roller tracks are equipped with a coverage which is easy to handle.

Operation is possible by a centrally placed control panel.

Cross cut saws

Economic and secure working processes at cross cut saws require the matching length stop systems with modern roller and measuring tracks.

This increases productivity, is expected by the employers' liability insurance associations and mandatory in some areas.

EXAKT roller and measuring tracks meet all the requirements posed and can be combined with any cross cut saw easily.

Manual or programmed control - EXAKT roller and measuring lanes ideally supplement undertable chop saws. Work takes place economically efficiently and safety. The result is just right - and exacting.

Roller and measuring tracks

Safety shield can be lowered pneumatically (Option)
Permits unhindered access to the workpiece.
With integrated safety switch.

Operating elements

The saw blade can be set into motion doubly secured must be operated with both hands.
An adjusting screw regulates the saw blade feed.

Protective hood

The saw blade is automatically covered by a stable cover during operation.

Blank holder

The automatic blank holder holds the workpiece while sawing is in progress.

Laser (Option)

The practical laser shows the operator precisely the right path.

Pneumatic horizontal clamp (Option)

Fastens the workpiece not only vertically but also horizontally.

Full protection hood (Option)

For special tasks, Beck cross cut saws can be equipped with an additional saw protection.

Inclined machine table (Option)

The construction slanted backwards by 10° causes the workpieces to slide to the stop elements more easily.
